

Name:Rugved Raut

Lab-2 PHP

1. Write a PHP script to demonstrate single-line and multi-line comments. Also, use magic constants to print the file name and the line number where the code is executed.

Code:

```
<?php
// This is a single-line comment

/*
This is a
multi-line comment
*/

echo "This code is executed in file: " . __FILE__ . "<br>";
echo "This code is written on line number: " . __LINE__;
?>
```

Output:

```
This code is executed in file: C:\xampp\htdocs\PHP Labs\Lab2.php
This code is written on line number: 10
```

2. Write a PHP script where:

1. You create a variable \$var1 and assign it the value "course".
2. You create another variable using \$\$var1 and assign it the value "PHP".
3. Print both variables using echo.

Code:

```
<?php
$var1 = "course";
$$var1 = "PHP";

echo "Value of var1: " . $var1 . "<br>";
echo "Value of course: " . $course;
?>
```

Output:

```
Value of var1: course
Value of course: PHP
```

3. Write a PHP script that:

1. Defines a constant PI with the value 3.1416.
2. Declares a variable \$radius and assigns it the value 7.
3. Calculates and prints the circumference and area of a circle using the formula: ○

Circumference = $2 \times \text{PI} \times \text{radius}$ ○ Area = $\text{PI} \times \text{radius}^2$

4. Use string concatenation and echo to display the results.

Code:

```
<?php
define("PI", 3.1416);
$radius = 7;

$circumference = 2 * PI * $radius;
$area = PI * $radius * $radius;

echo "The circumference of the circle is: " . $circumference . "<br>";
echo "The area of the circle is: " . $area;
?>
```

Output:

```
The circumference of the circle is: 43.9824
The area of the circle is: 153.9384
```
