

Lab-9 PHP

1. Create a parameterized function in PHP to check if a given number is prime.

Function Name: isPrime **Input:** An integer (n) **Output:** true if n is prime, otherwise false

Code:

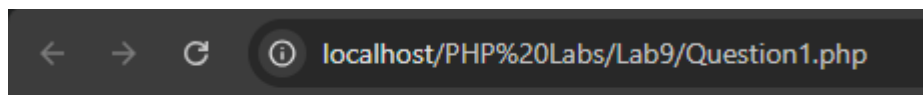

```
<?php
function isPrime($n)
{
    if ($n <= 1) {
        return false;
    }

    for ($i = 2; $i < $n; $i++) {
        if ($n % $i == 0) {
            return false;
        }
    }
    return true;
}

$number = 29;

if (isPrime($number)) {
    echo $number . " is a Prime Number.";
} else {
    echo $number . " is Not a Prime Number.";
}
?>
```

Output:

29 is a Prime Number.

2. Write a function to reverse a string without using the built-in strrev() function.

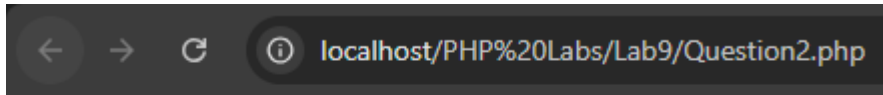

Function Name: reverseString **Input:** A string (str) **Output:** Reversed string

Code:

```
<?php
function reverseString($str)
{
    $rev = "";
    for ($i = strlen($str) - 1; $i >= 0; $i--) {
        $rev .= $str[$i];
    }
    return $rev;
}
```

```
$text = "HelloWorld";  
echo "Original String: " . $text . "<br>";  
echo "Reversed String: " . reverseString($text);  
?>
```

Output:

Original String: HelloWorld
Reversed String: dlroWolleH

3. Write a custom function to convert Fahrenheit to Celsius. Function Name: fahrenheitToCelsius Formula: $(\text{Fahrenheit} - 32) \times 5/9$ Input: Temperature in Fahrenheit (f) Output: Temperature in Celsius

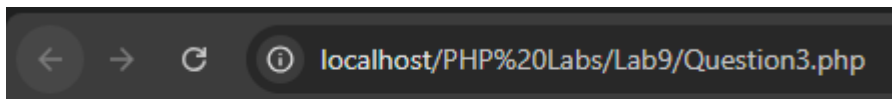

Code:

```
<?php  
function fahrenheitToCelsius($f)  
{  
    return ($f - 32) * 5 / 9;  
}
```

```
$fahrenheit = 98.6;  
$celsius = fahrenheitToCelsius($fahrenheit);
```

```
echo $fahrenheit . "°F is equal to " . round($celsius) . "°C";  
?>
```

Output:

98.6°F is equal to 37°C
