

Practical Lab Assignment

Exercise:

1. Create a Person class with:

- Properties: \$name, \$age
- A constructor to initialize these properties
- A method displayInfo() that prints name and age
- A destructor that prints "Object destroyed"

2. Instantiate two objects of the Person class.

3. Display the information of each object.

Code:

```
<?php
class Person {
    public $name;
    public $age;

    // Constructor to initialize properties
    function __construct($name, $age) {
        $this->name = $name;
        $this->age = $age;
    }

    // Method to display information
    function displayInfo() {
        echo "Name: " . $this->name . "<br>";
        echo "Age: " . $this->age . "<br><br>";
    }

    // Destructor
    function __destruct() {
        echo "Object destroyed<br>";
    }
}

// Creating first object
$person1 = new Person("Rugved", 21);
$person1->displayInfo();

// Creating second object
$person2 = new Person("Amit", 22);
$person2->displayInfo();
?>
```

Output:

Name: Rugved

Age: 21

Name: Amit

Age: 22

Object destroyed

Object destroyed
